Hi Alison,

We'd love to wait for v1 but our internal deadlines won't allow it. Do you have time for a quick call tomorrow?

Doug

Subject: RE: List of inventory updates in regional haze 2016fg/2028fg cases

Hi Doug,

We are wondering why you wouldn't want to wait for 2016v1 since it should be available by September?
It will be more robust for SIP purposes...

The 2016fg and 2028fg were meant to fill a need to meet a commitment we had made about a specific timeline, but we hadn't planned on them being used for other applications.

Alison

Subject: RE: List of inventory updates in regional haze 2016fg/2028fg cases

Good morning Alison,

We're not complete with our base year but getting closer. I did not download the 2028ff inventories. I know others are interested in the fg inventories now. Does EPA have concerns releasing the 2016/2028fg inventories before the modeling files?

Thanks,

Doug Boyer

Doug,

I'm thinking about this some more – are you already done with your base year run? If so, you are probably better off sticking with the 2028ff inventories, which I can definitely point you to. It wouldn't be appropriate to change the spatial allocations only in the future year – although perhaps it would still be reasonable to reduce the Canadian dust emissions in the future year.

Hi Alison,

No delay noticed! We'll need to use beta for our RH inventories. We'd like to get our future year runs going within the next month to meet our internal deadlines. So 2028 is of most interest/concern.

Thanks,

Doug

Doug,

Sorry about the delay – I had some computer crashes and lost track of this...
Are you planning to use beta or v1 for your regional haze runs?

FYI, the inventory-level changes related to reallocation of fires and regridding of the 2016 Canada inventory are available here:

<ftp://newftp.epa.gov/air/emismod/2016/beta/2016emissions/>

In particular, see:

[ftp://newftp.epa.gov/air/emismod/2016/beta/2016emissions/README 2016 beta platform package allocation update.txt](ftp://newftp.epa.gov/air/emismod/2016/beta/2016emissions/README%202016%20beta%20platform%20package%20allocation%20update.txt)

The other updates are not posted anywhere. What is the timing of you starting your runs?

Alison

Hi Alison,

Thanks for summarizing the changes to the beta inventories. We're getting ready to conduct our regional haze runs. Do you plan to share the fg versions to the States or the Collaborative before the September release? If not, are the ff versions still available?

Thanks,

Doug

Subject: List of inventory updates in regional haze 2016fg/2028fg cases

Hi everyone,

To follow up on Monday's call, I'm forwarding a list of the inventory changes made between beta (2016ff/2028ff) and the regional haze (2016fg/2028fg) cases.

The 2016ff modeling scenario used the 2016 beta inventory, as released, and is the case being reviewed by the model evaluation effort. For the regional haze modeling project (2016fg), minor emissions changes were made to the 2016ff inventory as follows:

1. Re-gridding of some Canadian primary PM emissions
 - a. Several categories of the Canadian emissions were received in a gridded format. Since the Canadian grids and the EPA grids did not match, a "waffle" pattern was observed in some of the EPA gridded data. EPA re-gridded the raw Canadian data to reflect the EPA 36km and 12km grids without the waffling.
2. Updated the spatial gridding of Georgia and Kansas prescribed fire emissions

- b. As submitted, the Kansas (Flint Hills) and Georgia prescribed fire emissions were gridded to county centroids. These emissions were re-gridded to spread the emissions out to other parts of each county (spatial allocation based on appropriate types of land use for these fires).
3. Updated prescribed fire emissions file for the 36/12km CAMx domain in 2-way nested mode
- c. The 2016fg CAMx run is being conducted with two-way nesting between the 36 and 12km grids. This resulted in additional work to create a combined gridded 36 and 12km point source prescribed fire emissions file (in a two-way nesting test run, the prescribed fire emissions were only emitted at 36km grid cell centroids). This issue only affects 2-way nested CAMx model runs.
4. Moved some sources from ptnonipm to ptegu as they were identified in recent IPM outputs (see the list later in this email). These sources were also removed from the 2028ff ptnonipm file to avoid double-counting with IPM.
5. Removed Canadian wind erosion dust from ag sources and adjusted several Canadian dust categories.
- d. In the 2016ff model run there were very high modeled “soil PM” concentrations in the spring in Alberta and Saskatchewan. We contacted Environment and Climate Change Canada and found they had already adjusted some of their dust categories downward. We applied adjustments to construction dust and removed wind erosion dust (since this category is not included in the US emissions).

Note that emissions updates 1, 2, 3 are spatial allocation changes only and do not change the emissions totals, nor does item 4. Emissions update 5 lowered the dust emissions in Canada. The regridded emissions from items 1-3 were made available to the modeling workgroup in late April – see ftp://newftp.epa.gov/air/emismod/2016/beta/2016emissions/README_2016_beta_platform_package_allocation_updates.txt

Note that the 2016fg and 2028fg emission will be released along with the modeling later this summer. Thus, they will become available to the public at that time.

Units moved to ptegu in 2016fg:
